Every element in HTML CSS Javascript is connected to each other. When trying to fix something, I need to consider those three files together, which could be challenging.

One of the challenges is trying to create new items in cart. I used "document.createElement("div")" to create a div for a new item, but found out the new item div I just added had an overlay with the previous item div. In stackoverflow.com, I found out there's a syntax "var.className" to give a new div a class name, so i can modify its height in CSS style. By giving div a height and margin, those term div looks more clear.
